## Motorcycle Helmet Use in 2005—Overall Results

Donna Glassbrenner, Ph.D.

In June 2005, 48 percent of motorcyclists in the U.S. used DOT-compliant helmets, a 10-point drop from the usage rate last year. This result is from the National Occupant Protection Use Survey (NOPUS), which provides the only probability-based observed data on helmet use in the United States. The NOPUS is conducted by the National Center for Statistics and Analysis of the National Highway Traffic Safety Administration (NHTSA). The 2005 survey also found the following:

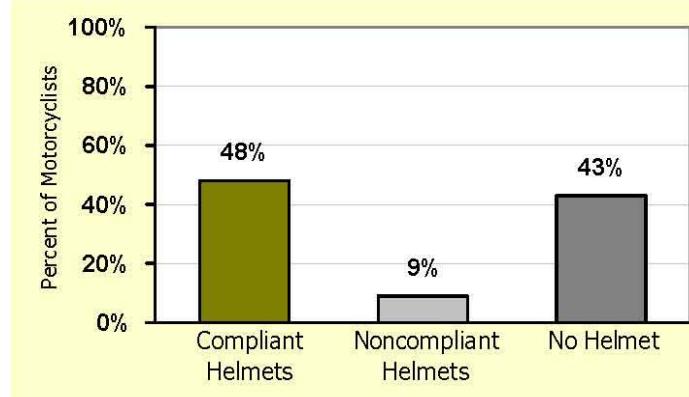

- The use of helmets that are not compliant with Federal safety regulations was 9 percent in 2005, statistically unchanged from the prior year. Such helmets include helmets with an insufficient coverage area or insufficient thickness to provide adequate protection in a crash.
- The drop in the use of DOT-compliant helmets occurred in States not requiring all motorcyclists to use helmets (a 10-point drop), and occurred on both expressways (a 9-point drop) and surface streets (a 10-point drop), among other categories.
- Use rates remain statistically lower in States that do not require all riders to use helmets. In 2005, 67 percent of motorcyclists in States requiring helmet use wore DOT-compliant helmets, compared to 38 percent in States not requiring all to use helmets.

<sup>1</sup> Use of helmets meeting the safety requirements of Federal Motor Vehicle Safety Standard 218, observed between 8 a.m. and 6 p.m. among motorcycle operators and passengers.

<sup>2</sup> Rates flagged with an "H" or "L" are statistically high or low in their category at a 90 percent confidence level.

<sup>3</sup> The degree of statistical confidence that the 2005 use rate is different from the 2004 rate.

<sup>4</sup> Use rates reflect the law in effect at the time data were collected.

NA: Data not collected or not sufficient to produce a reliable estimate.

<sup>1</sup> Use of helmets that do not meet the requirements of Federal Motor Vehicle Safety Standard 218, observed between 8 a.m. and 6 p.m. among motorcycle operators and passengers.

<sup>2</sup> Rates flagged with an "H" or "L" are statistically high or low in their category at a 90 percent confidence level.

<sup>3</sup> The degree of statistical confidence that the 2005 use rate is different from the 2004 rate.

<sup>4</sup> Use rates reflect the law in effect at the time data were collected.

NA: Data not collected or not sufficient to produce a reliable estimate.

## **Survey Methodology**

The National Occupant Protection Use Survey (NOPUS) is the only probability-based observational survey of motorcycle helmet use in the United States. The survey observes usage as it actually occurs at a random selection of roadway sites, and so provides the best tracking of helmet use in this country.

The survey data is collected by sending observers to a set of probabilistically sampled roadways, who observe motorcyclists between the hours of 8 a.m. and 6 p.m. Observations are made either while standing at the roadside or, in the case of expressways, while riding in a vehicle in traffic. Observers do not stop motorcycles or interview motorcyclists, so that the NOPUS captures the untainted behavior of riders. The 2005 NOPUS data were collected between June 6 and June 25, while the 2004 data were collected between June 7 and July 11, 2004, excluding the period July 2 – 5.

Because the NOPUS sites were chosen through probabilistic means, we can analyze the statistical significance of its results. Statistically significant increases in helmet use between 2004 and 2005 are identified in the table "Use of Helmets Compliant with Federal Safety Regulation, by Major Characteristics" by having a result that is 90 percent or greater in the table's column 7, and similarly for the subsequent table on the use of noncompliant helmets. Significantly high and low levels of helmet use, such as the lower use in States that do not require all motorcyclists to use helmets, are identified by H's and L's in columns 3 and 5. Such comparisons are made within categories, such as road type, delineated by changes in row shading in the tables. The exception to this is the grouping "Motorcyclists Traveling During ...," in which weekdays are compared to weekends, and weekday rush hour to weekday nonrush hour.

### **Sites, Motorcycles, and Motorcyclists Observed**

| Numbers of             | 2004  | 2005  | Percentage Increase |
|------------------------|-------|-------|---------------------|
| Sites Observed         | 2,000 | 2,000 | 0%                  |
| Motorcycles Observed   | 1,300 | 1,300 | 0%                  |
| Motorcyclists Observed | 1,600 | 1,700 | 6%                  |

The NOPUS uses a complex multistage probability sample, statistical data editing, imputation of unknown values, and complex estimation and variance estimation procedures. See the NHTSA Technical Report referenced below for more information on these procedures.

Data collection, estimation, and variance estimation for the NOPUS are conducted by Westat, Inc., under the direction of the National Center for Statistics and Analysis in NHTSA under Federal contract number DTNH22-00-D-07001.

## **Definitions**

NHTSA established standards for motorcycle helmets to ensure a certain degree of protection in a crash in Federal Motor Vehicle Safety Standard 218. (Code of Federal Register, Title 49, Volume 5, Part 571, Section 218, October 2003) *DOT-compliant helmets* are helmets that meet this safety standard, while *noncompliant helmets* are helmets that do not.

DOT-compliant helmets are marked with an identifying sticker on the back of the helmet. However because of the prevalence of counterfeit stickers, NOPUS data collectors categorize DOT-compliant helmets as helmets that reach the bottom of the motorcyclist's ears or are at least 1 inch thick.

NHTSA estimates helmet use as the use of DOT-compliant helmets.

"Expressways" are defined to be roadways with limited access, while "surface streets" comprise all other roadways.

A roadway is defined to have "fast traffic" if during the observation period the average speed of passenger vehicles that passed the observer(s) exceeded 50 mph, with "medium speed traffic" defined as 31 - 50 mph and "slow traffic" defined as 30 mph or slower.

### **States with Laws<sup>1</sup> Requiring Helmet Use for All Motorcycle Riders<sup>1</sup>**

|                      |             |                |
|----------------------|-------------|----------------|
| Alabama              | Michigan    | North Carolina |
| California           | Mississippi | Oregon         |
| District of Columbia | Missouri    | Tennessee      |
| Georgia              | Nebraska    | Vermont        |
| Louisiana            | Nevada      | Virginia       |
| Maryland             | New Jersey  | Washington     |
| Massachusetts        | New York    | West Virginia  |

<sup>1</sup>States and the District of Columbia with laws in effect as of June 30, 2004. The exception is Louisiana, whose law took effect in August 2004. No additional States enacted such laws during the period June 30, 2004 – June 30, 2005.

A roadway is defined to have "heavy traffic" if the average number of vehicles per lane mile on the roadway during the observation period exceeded 45 vehicles per lane mile, with "moderately dense traffic" defined as 26 - 45 vehicles per lane per mile and "light traffic" having at most 25 vehicles per lane per mile.

At the time the 2004 survey was conducted, 19 States and the District of Columbia required all motorcyclists to be helmeted. Other States either required only a subset of riders to use helmets (such as those under 18 years of age), or had no helmet requirement. Louisiana began requiring all motorcyclists to be helmeted beginning in August 2004.

## **For More Information**

For detailed analyses of the data in this publication, as well as additional data and information on the survey design and analysis procedures, see the upcoming publication "Motorcycle Helmet Use in 2005 – Overall Analysis," expected to be available at the Web site [www-nrd.nhtsa.dot.gov/departments/nrd-30/ncsa/AvailInf.html](http://www-nrd.nhtsa.dot.gov/departments/nrd-30/ncsa/AvailInf.html) later in 2005.

The NOPUS also observes other types of restraints, such as child restraints and safety belts, and observes driver cell phone use. This publication is part of a series that presents overall results from the survey on these topics. Please see other members of the series, such as "Child Restraint Use in 2005 – Overall Results," and the corresponding NHTSA Technical Report, "Child Restraint Use in 2005 –Analysis," for the latest data on these topics.
